

HB6519 GE Labeling

As a mother of 2, I was appalled to learn that much of the food that I have been feeding my children for over 2/3 of their lives is genetically modified. All this time I thought I was making wise healthy choices for my family.

There have been no long term studies proving that genetically modified foods are safe for humans or our environment. I do not want my family and the people I love to be guinea pigs while time tells whether or not GMO's are safe.

We know what we put on our bodies, and we have the same right to know what we are putting into our bodies. Just as we have labels for our clothing and personal care products telling us what they are made of, we have the right to know what is in our food and how they are made.

We need transparency...

If the companies that produce genetically modified foods feel that they are safe and beneficial to our food system, then they should proudly place a label on their products for all to see. Not putting a label on their products tells me they have something to hide and wish to keep the consumer in the dark.

Thank you,
